TITLE: Cosmetic detergent composition e.g. shampoo - having a rheology on pouring with a region of strain over which the viscosity remains constant and a region over which the viscosity decreases with increasing strain

INVENTOR: CAUWET-MARTIN, D; DUBIEF, C ; CAUWET, M D

ABSTRACTED-PUB-NO: EP 796615A

BASIC-ABSTRACT:

Cosmetic detergent composition comprising at least one anionic surfactant, at least one nonionic or amphoteric co-surfactant, at least one oxyalkylated silicone and at least one electrolyte, the relative amounts of these components being chosen such that the composition has (a) a rheological behaviour on pouring which exhibits a region of strain over which the viscosity remains constant followed by a region of strain in which the viscosity falls as the strain increases, and (b) a lamellar phase structure that keeps any non-water-soluble particles which maybe present in suspension.

USE - As compositions such as shampoos and shower gels form cleansing the hair, scalp or skin.

ADVANTAGE - The compositions are stable, have very good foaming properties and have the ability to maintain solid particles or liquid droplets of non-water-soluble materials in suspension, thus allowing the stable incorporation of conditioners, anti-dandruff agents, etc., into the composition.
